## For Trex® 140mm Transcend Decking

Please Read These Important Notes

- When installing Snap-LOC clips in direct sunlight especially on hot days, make sure you don't fix more than two end on end per joist at any one time. Being polymer-based, clips can expand slightly in the heat. This is not an issue once clips are fixed down.
- Thought should be given to finishing the last board option at the front of your deck before actual commencement of your deck.
- The KSL140N Snap-Loc clips are designed to fit only the 140mm Trex® Transcend Decking with Grooved edges in the deck board.
- Never fix boards relying on adhesive only. If fixing boards in areas without KlevaKlip make sure you use some type of mechanical fix. (eg screw)
- KlevaKlip is not suitable for non-square decks or irregular joist heights. Whilst the fixing of the boards into the KlevaKlip is fast and will save time over conventional hand fixing, it is important that extreme care is taken in installing your first row of KlevaKlips. This will govern the straightness of your deck.
- For non-square areas of your deck, it is best to use conventional Trex® fixing clips in conjunction with KlevaKlip Snap-LOC clips.

### ADHESIVES GUIDE FOR KLEVAKLIP KSL140N SNAP-LOC CLIPS

Board Type	Approved Adhesives	Coverage
Trex® 140mm Transcend Decking with Grooved Edges	Any MS, SMX or Polyurethane- based outdoor adhesive is acceptable.	Approx 1 Cartridge 12 sqm

### FASTENERS GUIDE FOR KLEVAKLIP KSL140N SNAP-LOC CLIPS

Joist Type	Fastener	Type & Size	Fasteners per clip
Timber (Hardwood or Softwood)	Screw	* Galvanised 8 gauge 20-25mm Button Head screw (head size less than 2mm)	2 per board space (8 per clip)
	Connector Nail	Galvanised Connector Nail 32mm x 3.2	2 per board space (8 per clip)
	Coil Nail	Duo-fast Galvanised Coil Nail 2.75 x 32mm	2 per board space (8 per clip)
Metal	Screw (self drilling)	Galvanised 10gauge 16mm Wafer Head screw (head size less than 2mm)	2 per board space (8 per clip)

**Note: All Galvanising or equivalent should as minimum meet Class 3 coating requirements. In high corrosion areas you should use stainless steel fixings.**

\*Use counter-sunk head screws if button heads are not available. When using counter-sunk head screws make sure the screw head is sitting below the 2mm rib on the clip.

For cyclone rated areas please refer to our Installation Instructions for Cyclone areas located on our installation info section of our web site.

## Step-1 Positioning the Front KlevaKlips to the Outer Side Joists

Starting from the outside front edge of your deck place a KlevaKlip on each one of your outer side Joists of your decking substructure.

Full deck board widths are recommended at the front of your deck, so at this point you need to consider the set-out of the deck:

- In order to address the fascia you are going to use (see Step 9), you need to make the decision on whether you wish to have an "overhang" finish, or a "flush" finish.

**For "overhang" finish – go to Step 1 (a)**

**For "flush" finish – go to Step 1 (b)**

### Step 1 (a) - Overhang Method

#### Refer to Step 9 (a)

Fix the clip to the front joist making sure the front of the "dovetail" joiner is flush with the front joist and fitting squarely to the outside edge of the joists.

When using the Trex® Square Edge Board, you will have to remove the outside teeth of the clip as shown in the diagram opposite and use the 4mm base of the clip as a packer.

**Important Note:** Cutting the clip with a drop saw will give you the cleanest cut however, it is critical you place a piece of Off-Cut decking into the clip prior to cutting, otherwise the vibration of the saw's teeth hitting the clips tooth can cause the tooth to shatter. For further details regarding cutting of the clips please refer to our installation video:

[www.klevaklip.com.au/TREX-Snap-Loc-Installation-Information](http://www.klevaklip.com.au/TREX-Snap-Loc-Installation-Information)

### Step 1 (b) - Flush Finish Method

#### Refer to Step 9 (b)

The Flush finish utilises the outside upright on the clip to secure the front edge deck board. You will also need to cut the outside tooth and base of the clip as shown in the diagram opposite, so as the gap between the front edge deck board and fascia board is correct.

Fix the clip to the joist making sure the front of the upright is flush with the front of the joists and lines up squarely to the outside edge of the joists.

Alternatively, you can screw fix the front board using colour-coded screws by cutting the whole upright off the clip and use the 4mm base of the clip as a packer.

### If starting from the back of your deck (at the house).

You can also use the flush finish method if you are starting from the back of your deck, however we suggest you place KlevaKlips on the end joists towards the front end of the deck to check squareness of the structure and ensure you can achieve full board widths at the front of the deck.

## Step 2- Fixing the Front KlevaKlips to the Outer Side Joists

Your first clips should be fixed by hand to ensure accuracy. The KSL140N requires two fasteners per board space (8 per clip) all fixed diagonally. When using a Coil Nailer gun fire directly into the middle of the nylon clip not the provided holes

**TIP: Time saving benefits can be achieved by utilising Coil Nailer gun to secure the inner rows of KlevaKlip's on to Timber Joists.**

Overhang KSL140N

Flush Finish KSL140N

### Step 3- Positioning the Front KlevaKlips to the Inside Joists

Once both outer side KlevaKlip's have been securely fastened to the end joists, run a string chalk line from one of the outer side KlevaKlip's across the inner joists of the deck on to the other outer side KlevaKlip.  
(See diagram opposite)

Pull string tightly and flick the string line and this will mark a chalk line on all the internal joists between the two outer side joists.  
(See diagram opposite)

Using this chalk line mark you can then correctly position the remainder of front KlevaKlips on to the other inner joists. Fix to the joists using the same fixing methods as described in **Step2.**

Using this method will align your inside KlevaKlips directly inline with your outside KlevaKlip's and alleviate any incorrect internal joist lengths.

### Step 4- Applying Adhesive to your Clips.

After you have completed laying your first row of KlevaKlips to your joists, it's time to apply a 2 x small dobs of adhesive approximately 8mm high by 8mm in diameter to your inner joists.  
(See diagram opposite)

For boards at the end of the joists and butt joints you will need 8mm full bead of adhesive across the clip.  
(See diagram opposite)

**TIP: By using black adhesive there is less chance of noticing if you accidentally smear the adhesive.**

### Step 5- Inserting your Deck Boards.

Place the complete length of the Trex® decking on a slight angle and insert the leading edge of the groove into all the teeth.

Once the complete length of the board's groove is engaged into all the teeth ensuring the outside Klevaklip uprights are visible on the outside edge of the Trex® decking, simply walk on the outside edge of the deck board until it engages into the KlevaKlips.

Repeat the processes in Step 4 and 5 until all the deck boards are inserted into the KlevaKlips.

## Step 6 - Butt Joins

**It is a requirement of Trex® to use double joisting at all Butt Joins.** (See diagram opposite).

Cut a piece of joist around 200mm long and fix half a clip to the top of the joist.

Attach your joist section to the side of the existing longer joist making sure that both Clips are perfectly aligned with each other.

Apply a bead 8mm high of adhesive across both sides of the clips. Insert your deck boards as instructed in Step 5 making sure you leave a 3mm gap at the butt joint as per Trex® installation requirements.

## Step 7- Installing the remaining KlevaKlips

Now you have completed your first front row of KlevaKlips and deck boards it is time to fix the remainder of the clips to the joists. Simply place the next KlevaKlip at the back end of the previous clip making sure both KlevaKlips are hard up against each other.

The "dovetail" joiner at the ends of the clip makes this fast and easy to get right.

Secure the remainder of the KlevaKlips to the joists using the same fixing methods as described in fixing the KlevaKlips **Step 2**, Apply adhesive as described in **Step 3** and Insert your deck board as described in **Step 4**.

## Step 8 - Modifying KlevaKlips

**Tip: You can design your deck width to suit full KlevaKlip lengths and Trex® board widths.**

However, in some cases you may have to cut the KlevaKlip to fit. This will happen at the back of the deck generally against the house end. KlevaKlip is designed either to take a half width board at this end or you can cut the KlevaKlip with snips to utilise any board width.

## Step 9 (a) – Finishing Front Edge Deck Board Overhang Method

**Step 1(a) detailed the first clip being installed to provide an "overhang" finish. Then:-**

Screw fix a 30mm x 30mm aluminium right-angle to the ends of your joists, ensuring the top of the angle is 4mm above the top of the joists – to keep it the same height as the KlevaKlip clips. Using a Trex® Square Edge board, top fix one screw per joist.

Drill holes in the aluminium angle between all the joists so as you can fix screws from underneath your board, then fix screws through the aluminium angle from underneath into the board.

Depending how your deck is constructed you can then screw fix a rebated Trex® Fascia board or Decking board to the front of the joist ends.

## Step 9 (b) – Finishing Front Edge Deck Board Flush Finish Method

**Step 1(b) detailed the first clip being installed to provide a "flush" finish. Then:-**

Screw fix a Trex® fascia board to the front of the joist ends, making sure the top of the Trex® fascia board is flush with top of the front edge board.
